Note that the power dissipation is higher compared to normal operating conditions due to the voltage drop across the intrinsic drain-source diode. The temperature protection is not active during reverse current operation! Input and Status currents have to be limited (see max. ratings page 2 and circuit page 7).

## Terms

## Input circuit (ESD protection)

ESD zener diodes are not to be used as voltage clamp at DC conditions. Operation in this mode may result in a drift of the zener voltage (increase of up to 1 V).

## Status output

ESD-Zener diode: 6.1 V typ., max 5 mA;  
 $R_{ST(ON)} < 380 \Omega$  at 1.6 mA, ESD zener diodes are not to be used as voltage clamp at DC conditions. Operation in this mode may result in a drift of the zener voltage (increase of up to 1 V).

## overvoltage output clamp

$V_{ON}$  clamped to 47 V typ.

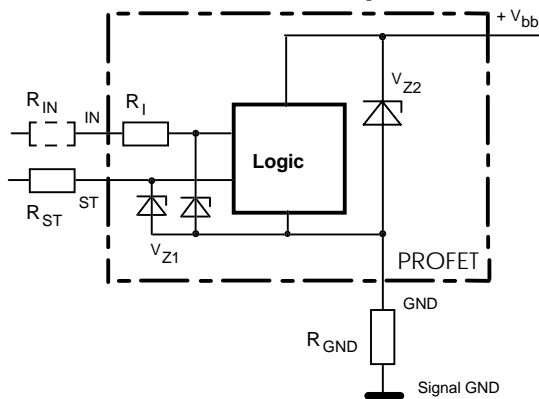

12) Power Transistor off, high impedance

13) with external resistor between pin 3 and pin 5

14) An external short of output to  $V_{bb}$ , in the off state, causes an internal current from output to ground. If  $R_{GND}$  is used, an offset voltage at the GND and ST pins will occur and the  $V_{ST\ low}$  signal may be errorious.

15) Low resistance to  $V_{bb}$  may be detected in ON-state by the no-load-detection

## Overvolt. and reverse batt. protection

$V_{Z1} = 6.2 \text{ V typ.}$ ,  $V_{Z2} = 47 \text{ V typ.}$ ,  $R_{GND} = 150 \Omega$ ,  
 $R_{ST} = 15 \text{ k}\Omega$ ,  $R_I = 3.5 \text{ k}\Omega \text{ typ.}$

## Open-load detection

ON-state diagnostic condition:  $V_{ON} < R_{ON} \cdot I_{L(OL)}$ ; IN high

OFF-state diagnostic condition:  $V_{OUT} > 3 \text{ V typ.}$ ; IN low

## GND disconnect

In case of Input=high is  $V_{OUT} \approx V_{IN} - V_{IN(T+)}$ .

Due to  $V_{GND} > 0$ , no  $V_{ST} = \text{low}$  signal available.

## GND disconnect with GND pull up

If  $V_{GND} > V_{IN} - V_{IN(T+)}$  device stays off

Due to  $V_{GND} > 0$ , no  $V_{ST} = \text{low}$  signal available.
