OCTAL TRANSCEIVER/REGISTER WITH 3-STATE OUTPUTS

These devices consist of bus transceiver circuits with 3-state D-type flip-flops, and control circuitry arranged for multiplexed transmission of data directly from the input bus or from the internal registers. Data on the A or B bus will be clocked into the registers as the appropriate clock pin goes to a high logic level. Output Enable (\overline{OE}) and DIR pins are provided to control the transceiver function. In the transceiver mode, data present at the high impedance port may be stored in either the A or the B register or in both. The select controls can multiplex stored and real-time (transparent mode) data. The direction control determines which bus will receive data when the enable \overline{OE} is Active LOW. In the isolation mode (\overline{OE} HIGH), A data may be stored in the B register and/or B data may be stored in the A register.

- Independent Registers for A and B
- Multiplexed Real-Time and Stored Data
- Choice of True (F646) and Inverting (F648) Data Paths
- 3-State Outputs

*The data output function may be enabled or disabled by various signals at the OE bar and DIR inputs. Data input functions are always enabled; i.e., data at the bus pins will be stored on every low-to-high transition of the appropriate clock inputs.

H = HIGH voltage level

L = LOW voltage level

X = Don't Care

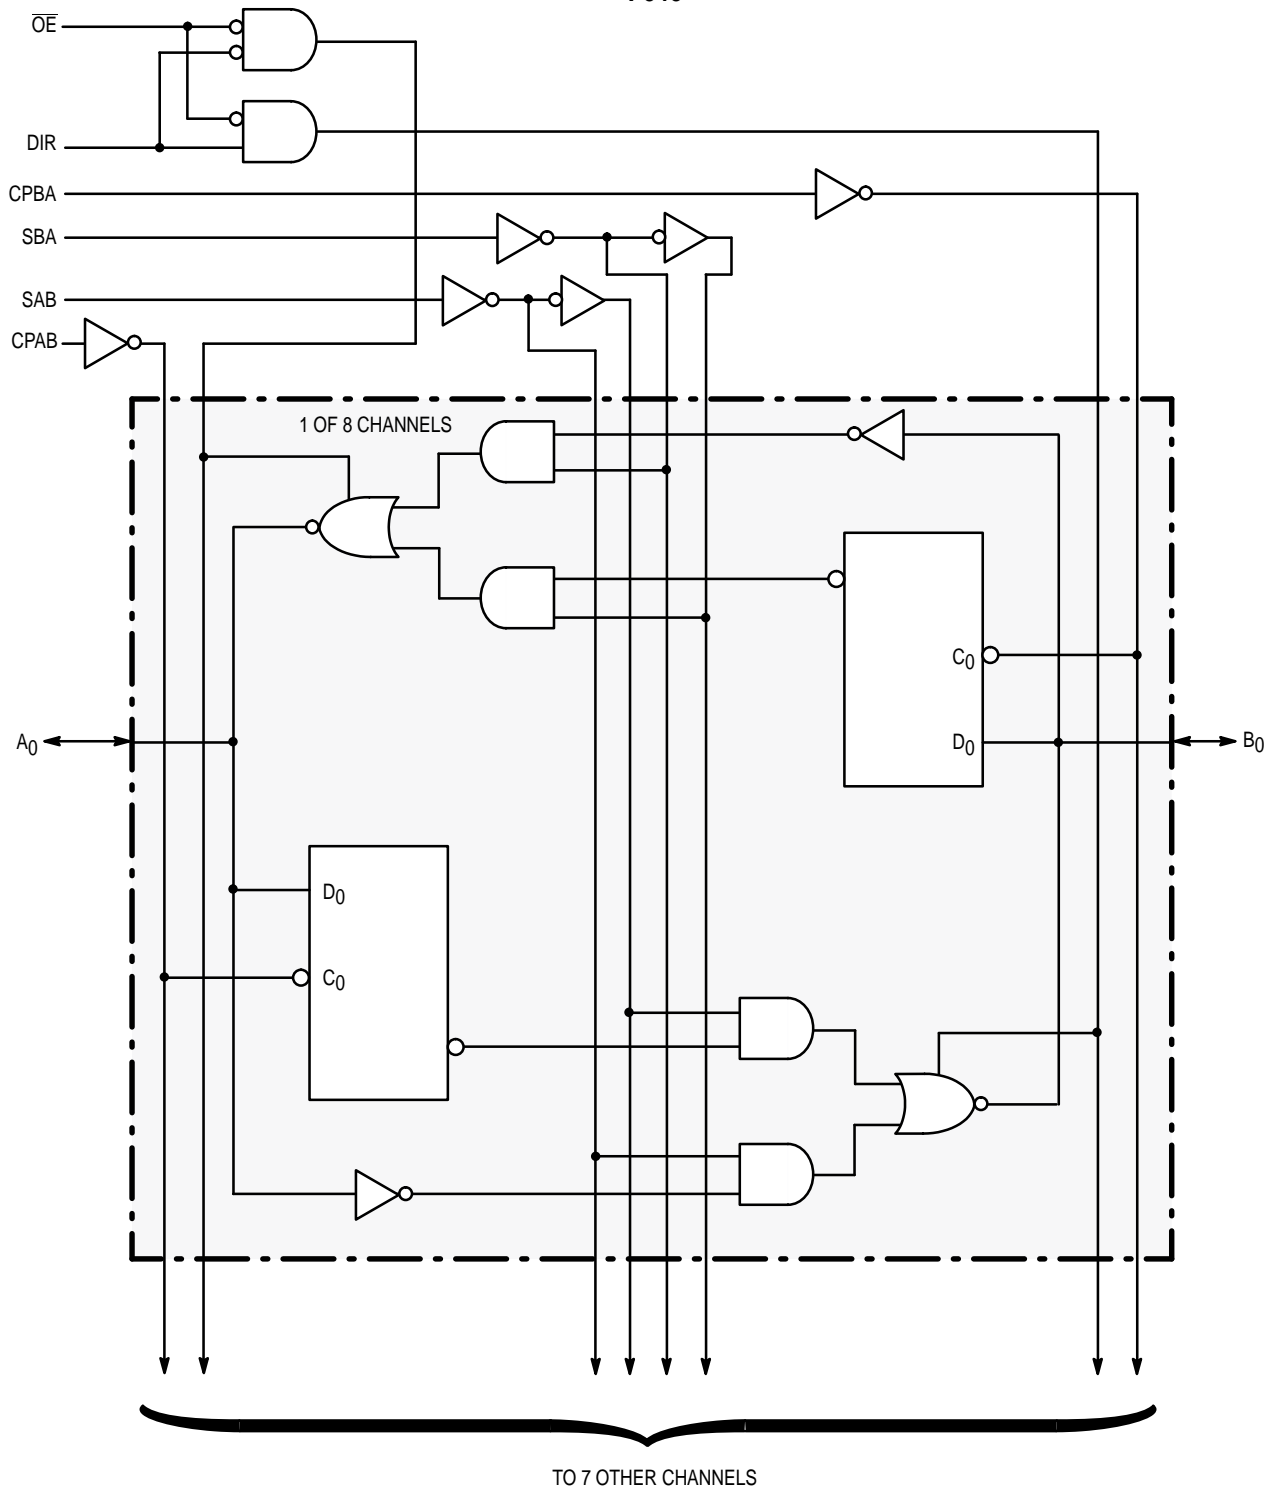

↑ = Low-to-High transition
