**LC33864P-80, M-70/80/10**

**512 K (65536 words × 8 bits) Pseudo-SRAM**

**Overview**

The LC33864 series is composed of pseudo static RAM that operate on a single 5 V power supply and is organized as 65536 words × 8 bits. By using memory cells each composed of a single transistor and capacitor, together with peripheral CMOS circuitry, this series achieves ease of use with high density, high speed, and low power dissipation. Since the LC33864 series products provide refresh counter and timer on chip, this series can easily accomplish auto-refresh and self-refresh by means of  $\overline{\text{RFSH}}$  input. The available packages are the 32-pin DIP with a width of 600 mil, and the 32-pin SOP with a width of 525 mil.

Self-refresh current 2 (average current)	$I_{CCF2}$	$\overline{CE} = V_{CC} - 0.2\text{ V}, \overline{RFSH} = 0.2\text{ V}$			1	mA

Output high level voltage	$V_{OH}$	$I_{OH} = -1\text{ mA}$		2.4		V	
Output low level voltage	$V_{OL}$	$I_{OL} = 2.1\text{ mA}$			0.4	V	

Notes: 3. All current values are measured at minimum cycle rate. Since current flows immoderately, if cycle time is longer than shown here, current value becomes smaller. A bypass capacitor of  $0.01\ \mu\text{F}$  or larger should be inserted between  $V_{CC}$  and  $\text{GND}$  for each memory chip to suppress power supply noise (voltage drops) due to transient currents.

4. Dependent on output load. Maximum value is value during free state.

### Input/Output Capacitance at $T_a = 25^\circ\text{C}$ , $V_{CC} = 5\text{ V} \pm 10\%$ , $f = 1\text{ MHz}$

Sampling inspections, and not full-lot inspections, are carried out for these parameters.

Refresh time (512 cycles, A0 to A8)	$t_{REF}$		8		8		8	ms	
Rise or fall times	$t_T$	3	50	3	50	3	50	ns	

Note: 5. To accomplish internal initialization,  $\overline{CE}$  is fixed at  $V_{IH}$  for an interval of 100  $\mu$ s when  $V_{CC}$  reaches the specified voltage after power is switched on. At least eight cycles must be executed following that period.

6. Measured at  $t_T = 5$  ns.

7. When measuring input signal timing,  $V_{IH}$  (min) and  $V_{IL}$  (max) are reference levels.

8. Measured using an equivalent of 100 pF and two standard TTL loads.

9.  $t_{CHZ}$ ,  $t_{OHZ}$  and  $t_{WHZ}$  are defined as the time until output enters the open circuit state and the output voltage level becomes immeasurable.

10. As with ordinary static RAM, write data is incorporated at the rise of  $\overline{WE}$  input or  $\overline{CE}$  input, whichever is earlier, and write data is therefore held during  $t_{psw}$ ,  $t_{DSC}$ ,  $t_{DHW}$ , or  $t_{DHC}$ .

11. Because address input is incorporated at the fall of  $\overline{CE}$ , the address is maintained during  $t_{ASC}$  or  $t_{AHC}$ .

12. Auto-refresh and self-refresh are determined by RFSH pulse width when  $\overline{CE} = V_{IH}$ , and are defined as auto-refresh when below  $t_{FAP}$  (max), or as self-refresh when above  $t_{FAS}$  (min). In order to activate  $\overline{CE}$  after the completion of each refresh,  $t_{FCE}$  must be assured for auto-refresh, or  $t_{FRS}$  must be assured for self-refresh.

Similarly, if self-refresh timing (RFSH = Low) is used after power is switched on,  $t_{FRS}$  must be assured.
