

Ultra-Low-Noise, High PSRR, Low-Dropout, 150mA Linear Regulators in μ DFN

General Description

The MAX8840/MAX8841/MAX8842 ultra-low-noise, low-dropout (LDO) linear regulators are designed to deliver up to 150mA continuous output current. These regulators achieve a low 120mV dropout for 120mA load current. The MAX8840 uses an advanced architecture to achieve ultra-low output voltage noise of 11 μ V_{RMS} and PSRR of 54dB at 100kHz.

The MAX8841 does not require a bypass capacitor, hence achieving the smallest PC board area. The MAX8842 output voltage can be adjusted with an external divider.

The MAX8840/MAX8841 are preset to a variety of voltages in the 1.5V to 4.5V range. Designed with a p-channel MOSFET series pass transistor, the MAX8840/MAX8841/MAX8842 maintain very low ground current (40 μ A).

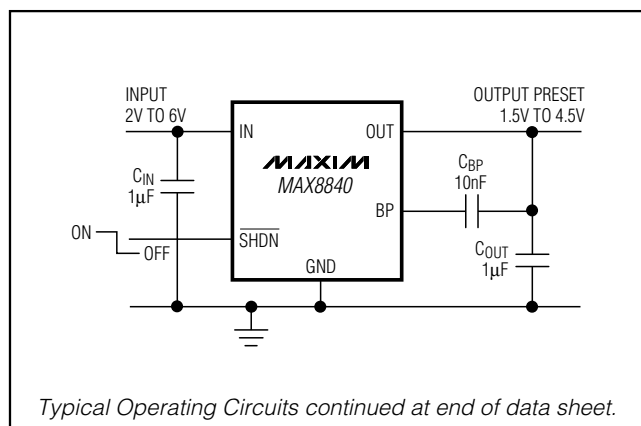

The regulators are designed and optimized to work with low-value, low-cost ceramic capacitors. The MAX8840 requires only 1 μ F (typ) of output capacitance for stability with any load. When disabled, current consumption drops to below 1 μ A.

The MAX8840/MAX8841/MAX8842 are available in a tiny 1mm x 1.5mm x 0.8mm μ DFN.

Applications

Cellular and Cordless Phones
PDA and Palmtop Computers
Base Stations
Bluetooth Portable Radios and Accessories
Wireless LANs
Digital Cameras
Personal Stereos
Portable and Battery-Powered Equipment

Typical Operating Circuits

Features

- ◆ Space-Saving 1.0mm x 1.5mm x 0.8mm μ DFN
- ◆ 11 μ V_{RMS} Output Noise at 100Hz to 100kHz Bandwidth (MAX8840)
- ◆ 78dB PSRR at 1kHz (MAX8840)
- ◆ 120mV Dropout at 120mA Load
- ◆ Stable with 1 μ F Ceramic Capacitor for Any Load
- ◆ Guaranteed 150mA Output
- ◆ Only Need Input and Output Capacitors (MAX8841)
- ◆ Output Voltages: 1.5V, 1.8V, 2.5V, 2.6V, 2.7V, 2.8V, 2.85V, 3V, 3.3V, 4.5V (MAX8840/MAX8841) and Adjustable (MAX8842)
- ◆ Low 40 μ A Ground Current
- ◆ Excellent Load/Line Transient
- ◆ Overcurrent and Thermal Protection

Pin Configuration

MAX8840/MAX8841/MAX8842

Ultra-Low-Noise, High PSRR, Low-Dropout, 150mA Linear Regulators in μ DFN

ABSOLUTE MAXIMUM RATINGS

IN to GND	-0.3V to +7V	θ_{JA}	477°C/W
Output Short-Circuit Duration	Infinite	Operating Temperature Range	-40°C to +85°C
OUT, SHDN to GND	-0.3V to (IN + 0.3V)	Junction Temperature	+150°C
FB, BP, N.C. to GND	-0.3V to (OUT + 0.3V)	Storage Temperature Range	-65°C to +150°C
Continuous Power Dissipation ($T_A = +70^\circ\text{C}$)		Lead Temperature (soldering, 10s)	+300°C
6-Pin μ DFN (derate 2.1mW/°C above +70°C)	0.168W		

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

($V_{IN} = V_{OUT} + 0.5V$, $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$, unless otherwise noted. $C_{IN} = 1\mu\text{F}$, $C_{OUT} = 1\mu\text{F}$, $C_{BP} = 10\text{nF}$. Typical values are at $+25^\circ\text{C}$; the MAX8842 is tested with 2.45V output, unless otherwise noted.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Input Voltage Range	V_{IN}		2		6	V
Output Voltage Accuracy		$I_{OUT} = 1\text{mA}$, $T_A = +25^\circ\text{C}$	-1		+1	%
		$I_{OUT} = 100\mu\text{A}$ to 80mA, $T_A = +25^\circ\text{C}$	-2		+2	
		$I_{OUT} = 100\mu\text{A}$ to 80mA	-3		+3	
Maximum Output Current	I_{OUT}		150			mA
Current Limit	I_{LIM}	OUT = 90% of nominal value	150	200	300	mA
Dropout Voltage (Note 2)		$V_{OUT} \geq 3V$, $I_{OUT} = 80\text{mA}$		80	170	mV
		$V_{OUT} \geq 3V$, $I_{OUT} = 120\text{mA}$		120		
		$2.5V \leq V_{OUT} < 3V$, $I_{OUT} = 80\text{mA}$		90	200	
		$2.5V \leq V_{OUT} < 3V$, $I_{OUT} = 120\text{mA}$		135		
		$2V \leq V_{OUT} < 2.5V$, $I_{OUT} = 80\text{mA}$		120	250	
		$2V \leq V_{OUT} < 2.5V$, $I_{OUT} = 120\text{mA}$		180		
Ground Current	I_Q	$I_{OUT} = 0.05\text{mA}$		40	90	μA
		$V_{IN} = V_{OUT(nom)} - 0.1V$, $I_{OUT} = 0\text{mA}$		220	500	
Line Regulation	V_{LNR}	$V_{IN} = (V_{OUT} + 0.5V)$ to 6V, $I_{OUT} = 0.1\text{mA}$		0.001		%/V
Load Regulation	V_{LDR}	$I_{OUT} = 1\text{mA}$ to 80mA		0.003		%/mA
Shutdown Supply Current	I_{SHDN}	$\overline{\text{SHDN}} = 0V$	$T_A = +25^\circ\text{C}$	0.003	1	μA
			$T_A = +85^\circ\text{C}$		0.05

		$f = 10\text{kHz}$, $I_{OUT} = 10\text{mA}$	MAX8840		75	
			MAX8841/MAX8842		65	
		$f = 100\text{kHz}$, $I_{OUT} = 10\text{mA}$	MAX8840		54	
			MAX8841/ MAX8842		46	

Ultra-Low-Noise, High PSRR, Low-Dropout, 150mA Linear Regulators in μ DFN

MAX8840/MAX8841/MAX8842

ELECTRICAL CHARACTERISTICS (continued)

($V_{IN} = V_{OUT} + 0.5V$, $T_A = -40^{\circ}C$ to $+85^{\circ}C$, unless otherwise noted. $C_{IN} = 1\mu F$, $C_{OUT} = 1\mu F$, $C_{BP} = 10nF$. Typical values are at $+25^{\circ}C$; the MAX8842 is tested with 2.45V output, unless otherwise noted.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Output Noise Voltage (RMS)		$f = 100Hz$ to $100kHz$, $I_{LOAD} = 10mA$	MAX8840	11		μV
			MAX8841/MAX8842	230		
		$f = 100Hz$ to $100kHz$, $I_{LOAD} = 80mA$	MAX8840	13		
			MAX8841/MAX8842	230		
Shutdown Exit Delay		$R_{LOAD} = 50\Omega$ (Note 3)			300	μs
\overline{SHDN} Logic-Low Level		$V_{IN} = 2V$ to $6V$			0.4	V
\overline{SHDN} Logic-High Level		$V_{IN} = 2V$ to $6V$	1.5			V
\overline{SHDN} Input Bias Current		$V_{IN} = 6V$, $\overline{SHDN} = 0V$ or $6V$	$T_A = +25^{\circ}C$			μA
			$T_A = +85^{\circ}C$	0.01		
FB Input Bias Current (MAX8842)		$V_{IN} = 6V$, $V_{FB} = 1.3V$	$T_A = +25^{\circ}C$	0.006	0.1	μA
			$T_A = +85^{\circ}C$	0.01		
Thermal Shutdown				160		$^{\circ}C$
Thermal-Shutdown Hysteresis				10		$^{\circ}C$

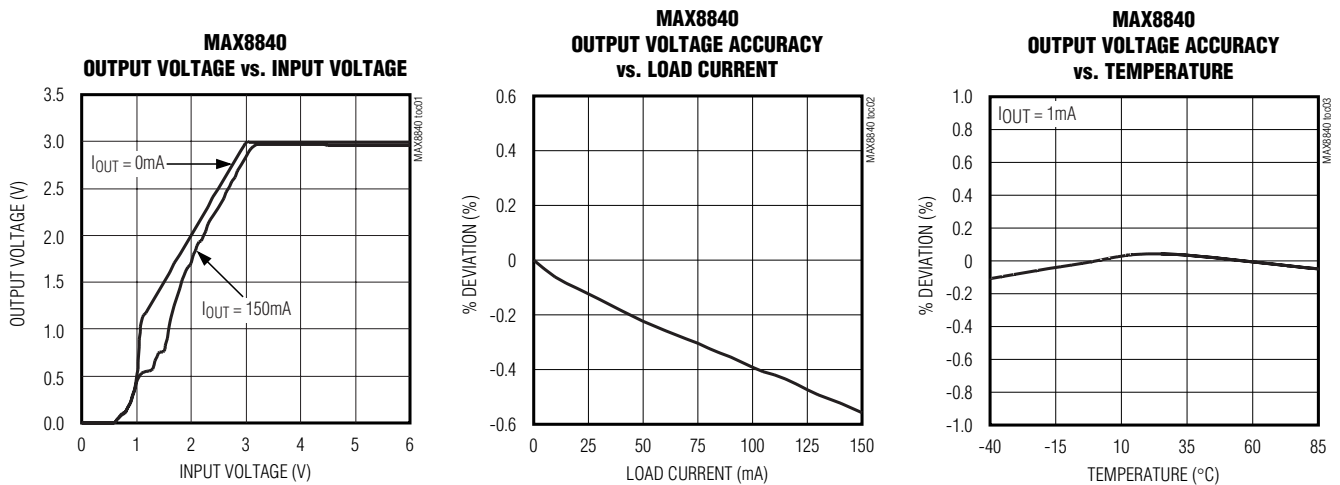

Note 1: Limits are 100% tested at $+25^{\circ}C$. Limits over operating temperature range are guaranteed by design.

Note 2: Dropout is defined as $V_{IN} - V_{OUT}$ when V_{OUT} is 100mV below the value of V_{OUT} for $V_{IN} = V_{OUT} + 0.5V$.

Note 3: Time needed for V_{OUT} to reach 90% of final value.

Typical Operating Characteristics

($V_{IN} = V_{OUT} + 0.5V$, $C_{IN} = 1\mu F$, $C_{OUT} = 1\mu F$, $C_{BP} = 10nF$, $T_A = +25^{\circ}C$, unless otherwise noted.)

($V_{IN} = V_{OUT} + 0.5V$, $C_{IN} = 1\mu F$, $C_{OUT} = 1\mu F$, $C_{BP} = 10nF$, $T_A = +25^\circ C$, unless otherwise noted.)

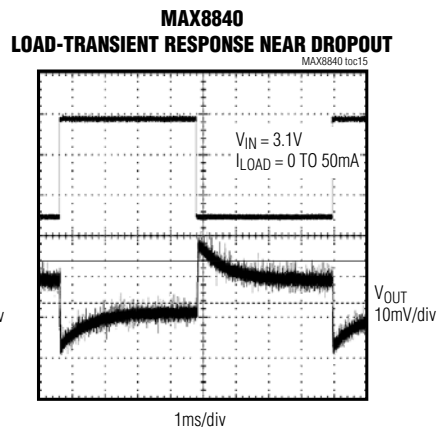

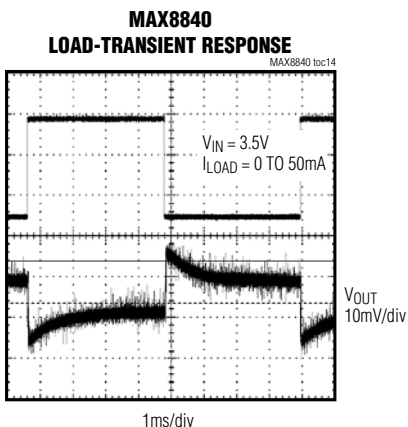

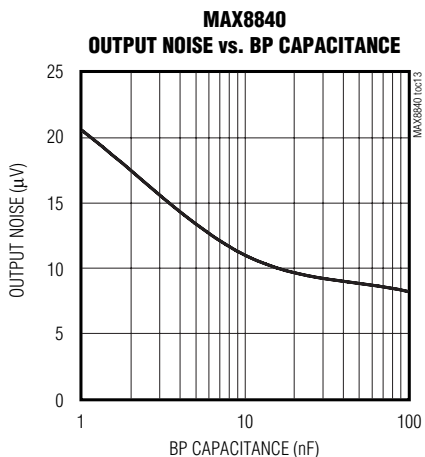

Ultra-Low-Noise, High PSRR, Low-Dropout, 150mA Linear Regulators in μ DFN

Typical Operating Characteristics (continued)

($V_{IN} = V_{OUT} + 0.5V$, $C_{IN} = 1\mu F$, $C_{OUT} = 1\mu F$, $C_{BP} = 10nF$, $T_A = +25^\circ C$, unless otherwise noted.)

MAX8840/MAX8841/MAX8842

Ultra-Low-Noise, High PSRR, Low-Dropout, 150mA Linear Regulators in μ DFN

Pin Description

PIN			NAME	FUNCTION
MAX8840	MAX8841	MAX8842		
1	1	1	IN	Unregulated Input Supply
2	2	2	GND	Ground
3	3	3	$\overline{\text{SHDN}}$	Shutdown. Pull low to disable the regulator.
4	—	—	BP	Noise Bypass for Low-Noise Operation. Connect a 10nF capacitor from BP to OUT. It is shorted to OUT in shutdown mode.
—	—	4	FB	Adjustable Output Feedback Point
5	4, 5	5	N.C.	No Connection. Not internally connected.
6	6	6	OUT	Regulated Output Voltage. Bypass with a capacitor to GND. See the <i>Capacitor Selection and Regulator Stability</i> section.

Detailed Description

The MAX8840/MAX8841/MAX8842 are ultra-low-noise, low-dropout, low-quiescent current linear regulators designed for space-restricted applications. The parts are available with preset output voltages ranging from 1.5V to 4.5V. These devices can supply loads up to 150mA. As shown in the *Functional Diagram*, the MAX8840/MAX8841 consist of an innovative bandgap core and noise bypass circuit, error amplifier, p-channel pass transistor, and internal feedback voltage-divider. The MAX8842 allows for adjustable output with an external feedback network.

The 1.225V bandgap reference is connected to the error amplifier's inverting input. The error amplifier compares this reference with the feedback voltage and amplifies the difference. If the feedback voltage is lower than the reference voltage, the pass-transistor gate is pulled low. This allows more current to pass to the output and increases the output voltage. If the feedback voltage is too high, the pass transistor gate is pulled high, allowing less current to pass to the output. The output voltage is fed back through an internal resistor voltage-divider connected to the OUT pin.

An external bypass capacitor connected to BP (MAX8840) reduces noise at the output. Additional blocks include a current limiter, thermal sensor, and shutdown logic.

Internal p-Channel Pass Transistor

The MAX8840/MAX8841/MAX8842 feature a 1 Ω (typ) p-channel MOSFET pass transistor. This provides several advantages over similar designs using a pnp pass transistor, including longer battery life. The p-channel MOSFET requires no base drive, which considerably

reduces quiescent current. PNP-based regulators waste considerable current in dropout when the pass transistor saturates. They also use high base-drive current under heavy loads. The MAX8840/MAX8841/MAX8842 do not suffer from these problems and consume only 40 μ A of quiescent current in light load and 220 μ A in dropout (see the *Typical Operating Characteristics*).

Output Voltage Selection

The MAX8840/MAX8841 are supplied with factory-set output voltages from 1.5V to 4.5V, in 100mV increments (see the *Ordering Information*). The MAX8842 features a user-adjustable output through an external feedback network (see the *Typical Operating Circuits*).

To set the output of the MAX8842, use the following equation:

$$R1 = R2 \times \left(\frac{V_{OUT}}{V_{REF}} - 1 \right)$$

where R2 is chosen to be less than 240k Ω and VREF = 1.225V. Use 1% or better resistors.

Shutdown

The MAX8840/MAX8841/MAX8842 feature a low-power shutdown mode that reduces quiescent current less than 1 μ A. Driving SHDN low disables the voltage reference, error amplifier, gate-drive circuitry, and pass transistor (see the *Functional Diagram*), and the device output enters a high-impedance state. Connect SHDN to IN for normal operation.

Current Limit

The MAX8840/MAX8841/MAX8842 include a current limiter, which monitors and controls the pass transistor's gate voltage, limiting the output current to 200mA.

Ultra-Low-Noise, High PSRR, Low-Dropout, 150mA Linear Regulators in μ DFN

For design purposes, consider the current limit to be 150mA (min) to 300mA (max). The output can be shorted to ground for an indefinite amount of time without damaging the part.

Thermal-Overload Protection

Thermal-overload protection limits total power dissipation in the MAX8840/MAX8841/MAX8842. When the junction temperature exceeds $T_J = +160^\circ\text{C}$, the thermal sensor signals the shutdown logic, turning off the pass transistor and allowing the IC to cool down. The thermal sensor turns the pass transistor on again after the IC's junction temperature drops by 10°C , resulting in a pulsed output during continuous thermal-overload conditions.

Thermal-overload protection is designed to protect the MAX8840/MAX8841/MAX8842 in the event of a fault condition. For continual operation, do not exceed the absolute maximum junction temperature rating of $T_J = +150^\circ\text{C}$.

Operating Region and Power Dissipation

The MAX8840/MAX8841/MAX8842 maximum power dissipation depends on the thermal resistance of the case and circuit board, the temperature difference between the die junction and ambient, and the rate of airflow. The power dissipation across the device is:

$$P = I_{OUT} (V_{IN} - V_{OUT})$$

The maximum power dissipation is:

$$P_{MAX} = (T_J - T_A) / (\theta_{JC} + \theta_{CA})$$

where $T_J - T_A$ is the temperature difference between the MAX8840/MAX8841/MAX8842 die junction and the surrounding air, θ_{JC} is the thermal resistance of the package, and θ_{CA} is the thermal resistance through the PC board, copper traces, and other materials to the surrounding air.

The GND pin of the MAX8840/MAX8841/MAX8842 performs the dual function of providing an electrical connection to ground and channeling heat away. Connect the GND pin to ground using a large pad or ground plane.

Noise Reduction

For the MAX8840, an external $0.01\mu\text{F}$ bypass capacitor between BP and OUT with an innovative noise bypass scheme reduces output noises dramatically, exhibiting $11\mu\text{VRMS}$ of output voltage noise with $C_{BP} = 0.01\mu\text{F}$ and $C_{OUT} = 1\mu\text{F}$. Startup time is minimized by a power-on circuit that precharges the bypass capacitor.

Applications Information

Capacitor Selection and Regulator Stability

Use a $1\mu\text{F}$ capacitor on the MAX8840/MAX8841/MAX8842 input and a $1\mu\text{F}$ capacitor on the output. Larger input capacitor values and lower ESRs provide better noise rejection and line-transient response. Reduce output noise and improve load-transient response, stability, and power-supply rejection by using large output capacitors. Note that some ceramic dielectrics exhibit large capacitance and ESR variation with temperature. With dielectrics such as Z5U and Y5V, it may be necessary to use a $2.2\mu\text{F}$ or larger output capacitor to ensure stability at temperatures below -10°C . With X7R or X5R dielectrics, $1\mu\text{F}$ is sufficient at all operating temperatures. A graph of the Region of Stable C_{OUT} ESR vs. Load Current is shown in the *Typical Operating Characteristics*.

Use a $0.01\mu\text{F}$ bypass capacitor at BP (MAX8840) for low-output voltage noise. The leakage current going into the BP pin should be less than 10nA . Increasing the capacitance slightly decreases the output noise. Values above $0.1\mu\text{F}$ and below $0.001\mu\text{F}$ are not recommended.

Noise, PSRR, and Transient Response

The MAX8840/MAX8841/MAX8842 are designed to deliver ultra-low noise and high PSRR, as well as low dropout and low quiescent currents in battery-powered systems. The MAX8840 power-supply rejection is 78dB at 1kHz and 54dB at 100kHz . The MAX8841/MAX8842 PSRR is 72dB at 1kHz and 46dB at 100kHz (see the Power-Supply Rejection Ratio vs. Frequency graph in the *Typical Operating Characteristics*).

When operating from sources other than batteries, improved supply-noise rejection and transient response can be achieved by increasing the values of the input and output bypass capacitors, and through passive filtering techniques. The *Typical Operating Characteristics* show the MAX8840/MAX8841/MAX8842 line- and load-transient responses.

Dropout Voltage

A regulator's minimum dropout voltage determines the lowest usable supply voltage. In battery-powered systems, this determines the useful end-of-life battery voltage. Because the MAX8840/MAX8841/MAX8842 use a p-channel MOSFET pass transistor, their dropout voltage is a function of drain-to-source on-resistance ($R_{DS(ON)}$) multiplied by the load current (see the *Typical Operating Characteristics*).
