**Note 1:** Absolute Maximum Ratings: are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

**Note 2:** Load and line regulation are specified at constant junction temperature. Change in  $V_O$  due to heating effects must be taken into account separately. Pulse testing with low duty is used. ( $P_{MAX} = 20S$ )

**Note 3:** CADJ, when used, is connected between the adjustment pin and ground.

### Typical Application

$$V_O = 1.25V (1 + R_2 / R_1) + I_{ADJ} R_2$$

**Note:**  $C_i$  is required when regulator is located an appreciable distance from power supply filter.

**Note:**  $C_o$  is not needed for stability, however, it does improve transient response.

**Note:** Since  $I_{ADJ}$  is controlled to less than 100  $\mu A$ , the error associated with this term is negligible in most applications.
