

CAT28C17A

16K-Bit CMOS PARALLEL EEPROM

FEATURES

- Fast Read Access Times: 200 ns
- Low Power CMOS Dissipation:
 - Active: 25 mA Max.
 - Standby: 100 μ A Max.
- Simple Write Operation:
 - On-Chip Address and Data Latches
 - Self-Timed Write Cycle with Auto-Clear
- Fast Write Cycle Time: 10ms Max
- End of Write Detection:
 - $\overline{\text{DATA}}$ Polling
 - RDY/BSY Pin
- Hardware Write Protection
- CMOS and TTL Compatible I/O
- 10,000 Program/Erase Cycles
- 10 Year Data Retention
- Commercial, Industrial and Automotive Temperature Ranges

DESCRIPTION

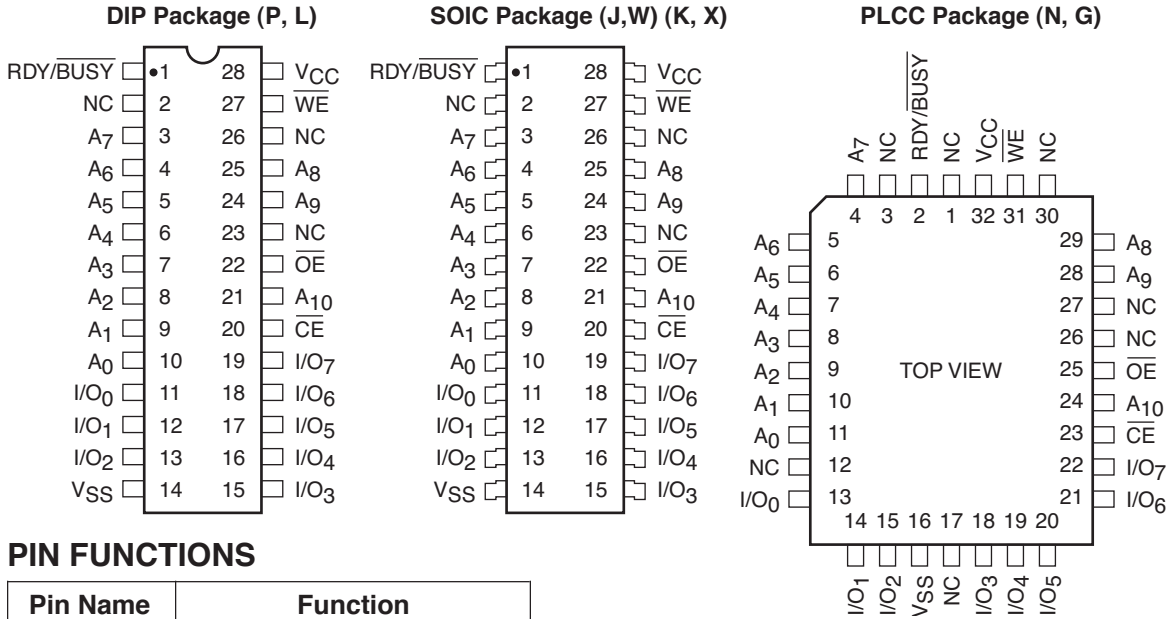

The CAT28C17A is a fast, low power, 5V-only CMOS parallel EEPROM organized as 2K x 8-bits. It requires a simple interface for in-system programming. On-chip address and data latches, self-timed write cycle with auto-clear and V_{CC} power up/down write protection eliminate additional timing and protection hardware. $\overline{\text{DATA}}$ Polling and a RDY/BSY pin signal the start and end of the self-timed write cycle. Additionally, the CAT28C17A features hardware write protection.

The CAT28C17A is manufactured using Catalyst's advanced CMOS floating gate technology. It is designed to endure 10,000 program/erase cycles and has a data retention of 10 years. The device is available in JEDEC approved 28-pin DIP and SOIC or 32-pin PLCC packages.

***COMMENT**

Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions outside of those listed in the operational sections of this specification is not implied. Exposure to any absolute maximum rating for extended periods may affect device performance and reliability.

Note:

- (1) This parameter is tested initially and after a design or process change that affects the parameter.
- (2) The minimum DC input voltage is -0.5V. During transitions, inputs may undershoot to -2.0V for periods of less than 20 ns. Maximum DC voltage on output pins is V_{CC} + 0.5V, which may overshoot to V_{CC} + 2.0V for periods of less than 20 ns.
- (3) Output shorted for no more than one second. No more than one output shorted at a time.
- (4) Latch-up protection is provided for stresses up to 100mA on address and data pins from -1V to V_{CC} + 1V.
- (5) V_{ILC} = -0.3V to +0.3V.
- (6) V_{IHC} = V_{CC} - 0.3V to V_{CC} + 0.3V.

Note:

- (1) This parameter is tested initially and after a design or process change that affects the parameter.
- (2) Output floating (High-Z) is defined as the state when the external data line is no longer driven by the output buffer.
- (3) Input rise and fall times (10% and 90%) < 10 ns.

A.C. CHARACTERISTICS, Write Cycle

$V_{CC} = 5V \pm 10\%$, unless otherwise specified.

Symbol	Parameter	28C17A-20		Units
		Min.	Max.

t_{DL}	Data Latch Time	50		ns
$t_{INIT}^{(1)}$	Write Inhibit Period After Power-up	5	20	ms
t_{DB}	Time to Device Busy		80	ns

Note:

- (1) This parameter is tested initially and after a design or process change that affects the parameter.
 (2) A write pulse of less than 20ns duration will not initiate a write cycle.

DEVICE OPERATION

Read

Data stored in the CAT28C17A is transferred to the data bus when \overline{WE} is held high, and both \overline{OE} and \overline{CE} are held low. The data bus is set to a high impedance state when either \overline{CE} or \overline{OE} goes high. This 2-line control architecture can be used to eliminate bus contention in a system environment.

Ready/ \overline{BUSY} (RDY/ \overline{BUSY})

The RDY/ \overline{BUSY} pin is an open drain output which indicates device status during programming. It is pulled low during the write cycle and released at the end of programming. Several devices may be OR-tied to the same RDY/ \overline{BUSY} line.

Figure 3. Read Cycle

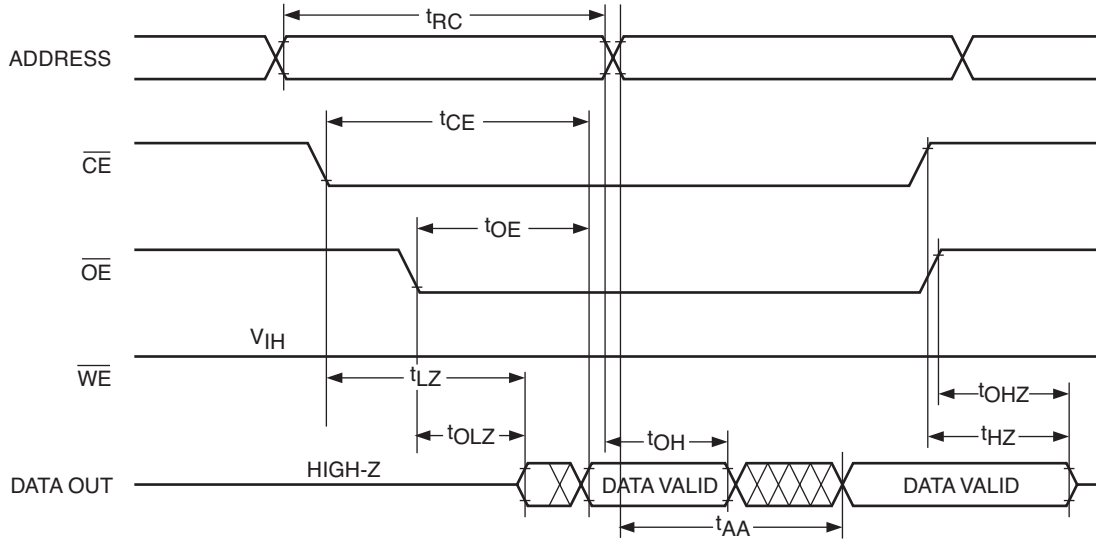

Figure 4. Byte Write Cycle [\overline{WE} Controlled]

Byte Write

A write cycle is executed when both \overline{CE} and \overline{WE} are low, and \overline{OE} is high. Write cycles can be initiated using either \overline{WE} or \overline{CE} , with the address input being latched on the falling edge of \overline{WE} or \overline{CE} , whichever occurs last. Data, conversely, is latched on the rising edge of \overline{WE} or \overline{CE} , whichever occurs first. Once initiated, a byte write cycle automatically erases the addressed byte and the new data is written within 10 ms.

DATA Polling

\overline{DATA} polling is provided to indicate the completion of a byte write cycle. Once a byte write cycle is initiated, attempting to read the last byte written will output the complement of that data on I/O_7 (I/O_0 – I/O_6 are indeterminate) until the programming cycle is complete. Upon completion of the self-timed byte write cycle, all I/O 's will output true data during a read cycle.

HARDWARE DATA PROTECTION

The following is a list of hardware data protection features that are incorporated into the CAT28C17A.

- (1) V_{CC} sense provides for write protection when V_{CC} falls below 3.0V min.
- (2) A power on delay mechanism, t_{INIT} (see AC characteristics), provides a 5 to 20 ms delay before a write sequence, after V_{CC} has reached 3.0V min.
- (3) Write inhibit is activated by holding any one of \overline{OE} low, \overline{CE} high or \overline{WE} high.
- (4) Noise pulses of less than 20 ns on the \overline{WE} or \overline{CE} inputs will not result in a write cycle.
