

# FHP3194

## 4:1 High-Speed Multiplexer

### Features

- 0.1dB gain flatness to 90MHz @ 2V<sub>pp</sub>
- 0.02%/0.05° differential gain/phase error
- 500MHz large signal -3dB bandwidth at G = 2
- 2200V/μs slew rate
- 75mA output current (easily drives two video loads)
- 70dB channel-to-channel isolation
- 13mA supply current
- 3.5mA supply current in disable mode
- 2.5mA supply current in shutdown mode
- Fully specified at ±5V supplies
- Lead-free SOIC-14 and TSSOP-14 packages

### Applications

- Video switchers and routers
- Multiple input HDTV switching
- Picture-in-picture video switch
- Multi-channel ADC driver

### Description

The FHP3194 is a 4:1 analog multiplexer designed for high-speed video applications. The output amplifier is a high-speed current feedback amplifier that offers stellar large signal performance of 500MHz -3dB bandwidth and 90MHz 0.1dB bandwidth. The gain of the output amplifier is selectable through two external resistors (R<sub>f</sub> and R<sub>g</sub>), allowing further design flexibility. The 2V<sub>pp</sub> bandwidth performance and 2200V/μs slew rate exceed the requirements of high-definition television (HDTV) and other multimedia applications. The output amplifier also provides ample output current to drive multiple video loads.

Two address bits (A0 and A1) are used to select one of the four inputs. The FHP3194 offers better than 70dB channel isolation.

The FHP3194 offers both shutdown and disable capability. During shutdown, the FHP3194 consumes only 2.5mA of supply current. During disable mode, only the output amplifier is disabled, reducing output glitches and allowing for multiplexer expansion.

### Functional Block Diagram

### Ordering Information

Part Number	Package	Pb-Free	Operating Temperature Range	Packaging Method
FHP3194IM14X	SOIC-14	Yes	-40°C to +85°C	Reel
FHP3194IMTC14X	TSSOP-14	Yes	-40°C to +85°C	Reel

Moisture sensitivity level for all parts is MSL-1.

## Pin Configuration

## Pin Assignments

Pin#	Pin Name	Description
1	IN1	Input, channel 1
2	GND	Must be connected to ground
3	IN2	Input, channel 2
4	GND	Must be connected to ground
5	IN3	Input, channel 3
6	-Vs	Negative supply
7	IN4	Input, channel 4
8	A0	Logic input A0
9	A1	Logic input A1
10	$\overline{EN}$	Enable pin, "1" = Disable, "0" = Enable; Enabled when left floating
11	SD	Shutdown pin, "1" = Shutdown, "0" = Active; Active when left floating
12	-VIN	Inverting Input of output amplifier
13	OUT	Output
14	+Vs	Positive supply

## Truth Table

A0	A1	$\overline{EN}$	SD	OUT
1	1	0	0	CH4
0	1	0	0	CH3
1	0	0	0	CH2
0	0	0	0	CH1
X	X	1	0	Disable
X	X	X	1	Shutdown

## Absolute Maximum Ratings

The “Absolute Maximum Ratings” are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum ratings. The “Recommended Operating Conditions” table defines the conditions for actual device operation.

Parameter	Min.	Max.	Unit
Supply Voltage	0	12.6	V
Input Voltage Range	$-V_s - 0.5V$	$+V_s + 0.5V$	V

## Reliability Information

Parameter	Min.	Typ.	Max.	Unit
Junction Temperature			150	°C
Storage Temperature Range	-65		150	°C
Lead Temperature (Soldering, 10s)			300	°C
Package Thermal Resistance				
14-Lead TSSOP <sup>1</sup>		113		°C/W
14-Lead SOIC <sup>1</sup>		125		°C/W

### Notes:

1. Package thermal resistance ( $\theta_{JA}$ ), JEDEC standard, multi-layer test boards, still air.

## ESD Protection

Product	SOIC-14	TSSOP-14
Human Body Model (HBM)	3.5kV	3kV
Charged Device Model (CDM)	2kV	2kV

## Recommended Operating Conditions

Parameter	Min.	Typ.	Max.	Unit
Operating Temperature Range	-40		+85	°C
Supply Voltage Range	5		12	V

## Application Information

### Circuit Diagrams

Figure 31. Typical Application Circuit 6dB Gain (G = 2)

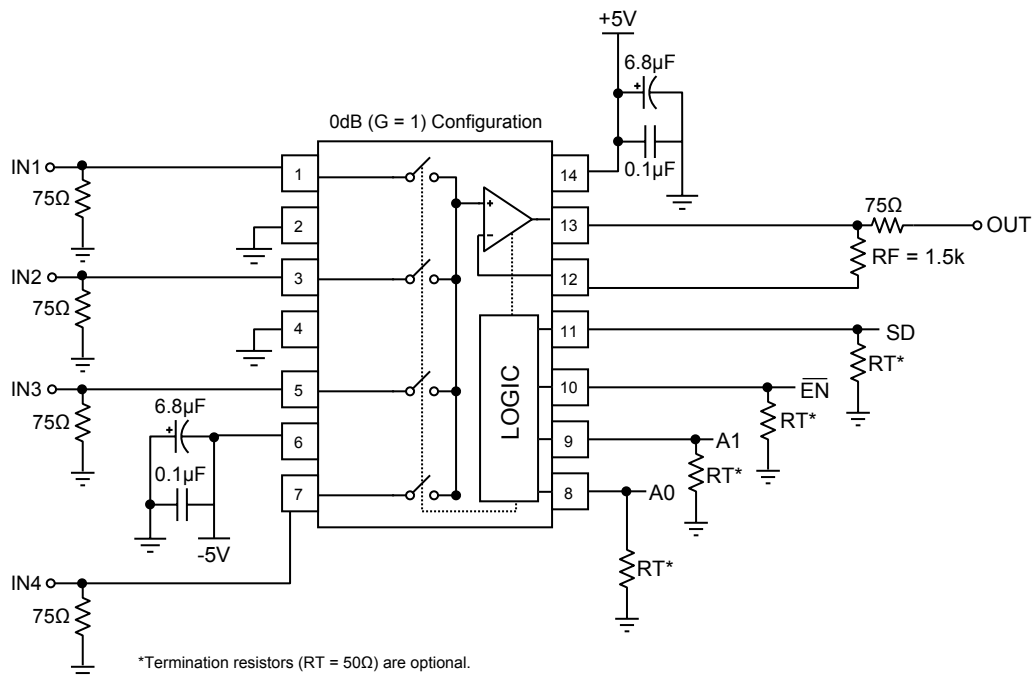

Figure 32. Typical Application Circuit 0dB Gain (G = 1)

## Application Information

### General Description

The FHP3194 4:1 multiplexer has four analog switches that drive the positive input of a high-speed current feedback amplifier. It is designed so that only one channel is on at a time. Tie unused inputs to ground.

Figures 31 and 32 show typical application circuits for the FHP3194 in 6dB ( $G = 2$ ) and 0dB ( $G = 1$ ) configurations.

### $R_f$ and $R_g$ Selection

The output of the FHP3194 is a current feedback amplifier. The gain of this amplifier is set by two external resistors:  $R_f$  and  $R_g$ . The frequency response and closed-loop bandwidth of the current feedback amplifier are highly dependant on the value of  $R_f$ . For a gain of two, use  $R_f = 475\Omega$ . For other gains, refer to the  $R_f$  vs. GAIN plot in Figure 3. In general, a lower  $R_f$  peaks the frequency response and increases bandwidth, while a higher  $R_f$  will decrease bandwidth and roll off the frequency response. A feedback resistor is required for unity gain ( $G = 1$ ); the recommended value is  $1.5k\Omega$ .

### A0, A1

The A0 and A1 logic pins are TTL/CMOS compatible and are used to select which of the four inputs connects to the output. Refer to the TRUTH TABLE on page 2 for more information. Channel 1 is selected if both pins are left floating.

### $\overline{EN}$ , SD

The FHP3194 offers both shutdown and disable capability. The  $\overline{EN}$  (enable) pin is active low. During disable mode ( $\overline{EN} = 1$ ), only the output amplifier is disabled, reducing output glitches and allowing for multiplexer expansion. The FHP3194 is enabled when the  $\overline{EN}$  pin is left floating or grounded.

The SD (shutdown) pin is active high. During shutdown ( $SD = 1$ ), the FHP3194 consumes only 2.5mA of supply current. The FHP3194 is enabled when the SD pin is left floating or grounded.

### Supply Voltage

The FHP3194 operates from a single supply of 5V to 12V or dual supplies of  $\pm 2.5V$  to  $\pm 6.0V$ . For low supply voltage operation, ensure that the common mode input voltage range (CMIR) or output voltage range ( $V_o$ ) are not exceeded. Exceeding the CMIR or  $V_o$  range puts the FHP3194 into an overdrive condition. For example, the typical CMIR for the FHP3194 is  $\pm 3.1V$  at  $\pm 5V$  supply, which means 1.9V of headroom is required from each supply.

At a single 5V supply, the CMIR becomes 1.9V to 3.1V. The same theory can be applied to the  $V_{OUT}$  range.

### Driving Video

The FHP3194 is designed to drive high-speed video. 90MHz 0.1dB bandwidth at  $2V_{pp}$  output,  $0.02^\circ/0.05\%$  differential gain/phase, and  $\pm 75mA$  output current make the FHP3194 suitable for driving standard-definition, high-definition, or PC graphics video.

### Driving Video with a Single 5V Supply

The FHP3194 drives video signals from a single 5V supply at  $G = 1$  only. At higher gains, the CMIR and  $V_o$  range is not suitable for passing video without clipping the signal.

### Driving Capacitive Loads

The FREQUENCY RESPONSE VS.  $C_L$  plot in Figure 5, illustrates the response of the FHP3194. A small series resistance ( $R_s$ ) at the output of the amplifier, illustrated in Figure 33, improves stability and settling performance.  $R_s$  values in the FREQUENCY RESPONSE VS.  $C_L$  plot were chosen to achieve maximum bandwidth with less than 1dB of peaking. For maximum flatness, use a larger  $R_s$ .

Figure 33. Typical Topology for Driving Capacitive Loads

### Power Dissipation

The maximum internal power dissipation allowed is directly related to the maximum junction temperature. If the maximum junction temperature exceeds  $150^\circ C$  for an extended time, device failure may occur. The FHP3194 is short-circuit protected; however, this may not guarantee that the maximum junction temperature ( $+150^\circ C$ ) is not exceeded under all conditions. RMS power dissipation can be calculated using the following equation:

$$\text{Power Dissipation} = I_s * (V_{s+} - V_{s-}) + (V_{s+} - V_{o(RMS)}) * I_{OUT(RMS)}$$

where  $I_s$  is the supply current,  $V_{s+}$  is the positive supply pin voltage,  $V_{s-}$  is the negative supply pin voltage,  $V_{o(RMS)}$  is the RMS output voltage, and  $I_{OUT(RMS)}$  is the RMS output current delivered to the load. Follow the maximum power derating curves shown in Figure 34 to ensure proper operation.

**Figure 34. Maximum Power Derating**

**Figure 35. Overdrive Recovery**

### Overdrive Recovery

For an amplifier, an overdrive condition occurs when the output and/or input ranges are exceeded. The recovery time varies based on whether the input or output is overdriven and by how much the ranges are exceeded. The FHP3194 typically recovers in less than 75ns from an overdrive condition. Figure 35 shows the FHP3194 in an overdriven condition.

### Layout Considerations

General layout and supply bypassing play major roles in high-frequency performance. Fairchild has evaluation boards to use as a guide for high-frequency layout and as aid in device testing and characterization. Follow the guidelines below as a basis for high-frequency layout:

- Include 6.8µF and 0.1µF ceramic capacitors.
- Place the 6.8µF capacitor within 0.75 inches of the power pin.
- Place the 0.1µF capacitor within 0.1 inches of the power pin.
- Remove the ground plane under and around the part, especially near the input and output pins and under  $R_f$  and  $R_g$ , to reduce parasitic capacitance.
- Minimize all trace lengths to reduce series inductances.

For current feedback amplifiers, stray capacitance from the inverting input (pin 12) to ground or to the output (pin 13) increases peaking in the AC response. For optimum performance, place  $R_f$  and  $R_g$  as close to the FHP3194 as possible. Small-size surface-mount resistors are recommended.

Avoid the use of vias near the device; vias add unwanted inductance.

If traces of greater than one inch are required, use stripline or microstrip techniques designed with characteristic impedances of 50Ω or 75Ω that are properly terminated with impedance-matching elements at each end.

Refer to the evaluation board layouts for more information.

### Evaluation Board Information

The following evaluation boards are available to aid in the testing and layout of these devices:
