DG508A  
CMOS Analog Multiplexers

FN3137  
Rev 6.00  
Mar 4, 2009

The DG508A is a CMOS Monolithic 8-Channel Analog Multiplexer, which can also be used as a demultiplexer. An enable input is provided. When the enable input is high, a channel is selected by the address inputs, and when low, all channels are off.

A channel in the ON state conducts current equally well in both directions. In the OFF state each channel blocks voltages up to the supply rails. The address inputs and the enable input are TTL and CMOS compatible over the full specified operating temperature range.

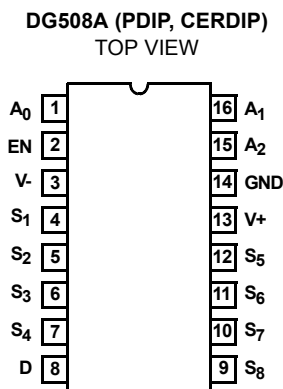

The DG508A is pinout compatible with the industry standard devices.

**Ordering Information**

NOTES:

- Typical values are for design aid only, not guaranteed and not subject to production testing.
- The algebraic convention whereby the most negative value is a minimum, and the most positive value is a maximum, is used in this data sheet.
- Off isolation =  $20\text{Log} |V_{\text{S}}|/|V_{\text{D}}|$ , where  $V_{\text{S}}$  = input to Off switch, and  $V_{\text{D}}$  = output due to  $V_{\text{S}}$ .
- $I_{\text{D(ON)}}$  is leakage from driver into "ON" switch.
- Parameter not tested. Parameter guaranteed by design or characterization.
